

This is a chance to earn back some of the points you lost on the first part of the project. Take some time and address each of the comments made on your submission. If you think what you did was correct, show your reasoning as a comment response. It is important that you really explain all of your assumptions and requirements before we move toward normalization and implementation. At this point you can still have non-atomic fields and their subparts, multivalued attributes, and derived attributes.

Make all of your corrections on the document I graded for Project 1. If you need to make a comment that is not a change in the actual text, use the comments feature on the Review tab of Word. All comments must be addressed either by a change in the document or a response comment. Do not remove any of my comments. Once we agree on the issue, I will delete the comment. We will continue to use this same document for the whole project. Remember to change the heading information to reflect the appropriate assignment.

You can receive a maximum of half of the points you lost on part one of the project. Again please submit as soon as possible so I can get the grading done in a timely fashion.
